

## Chinese pond mussel

(*Sinanodonta woodiana*)

Freshwater mussel, originated in South-East Asia. Introduced in Europe via Romania in the 1960s, in the form of glochidia (larval stage) in imported fish.

### Description

- Bulging shell, 15 to 30 cm long, thick and solid, highly convex lower edge
- Variable colour, clearly marked ridges
- Inner face covered with pink nacre
- Characteristic 5 to 8 ridges (thick, raised lines) near the summit (hinge) of the shell, clearly defined and distant from each other

### Ecology and reproduction

- The mussels develop on beds with a fine grain size (mud, sand, gravel) in lentic waters
- The primary food source is phytoplankton
- They are highly tolerant of pollution and can live in both warm and cold waters
- Reproduction takes place in the summer and several emissions of larva are possible
- The larva, called glochidia, have a hook that attaches to the gills of fish (encystment). This technique enables their dissemination
- The glochidia do not target a specific host, though frequent hosts are grass carp, black carp, bighead carp, silver carp and topmouth gudgeon
