Sea Defence Set-Back Trial

Tollesbury Fleet

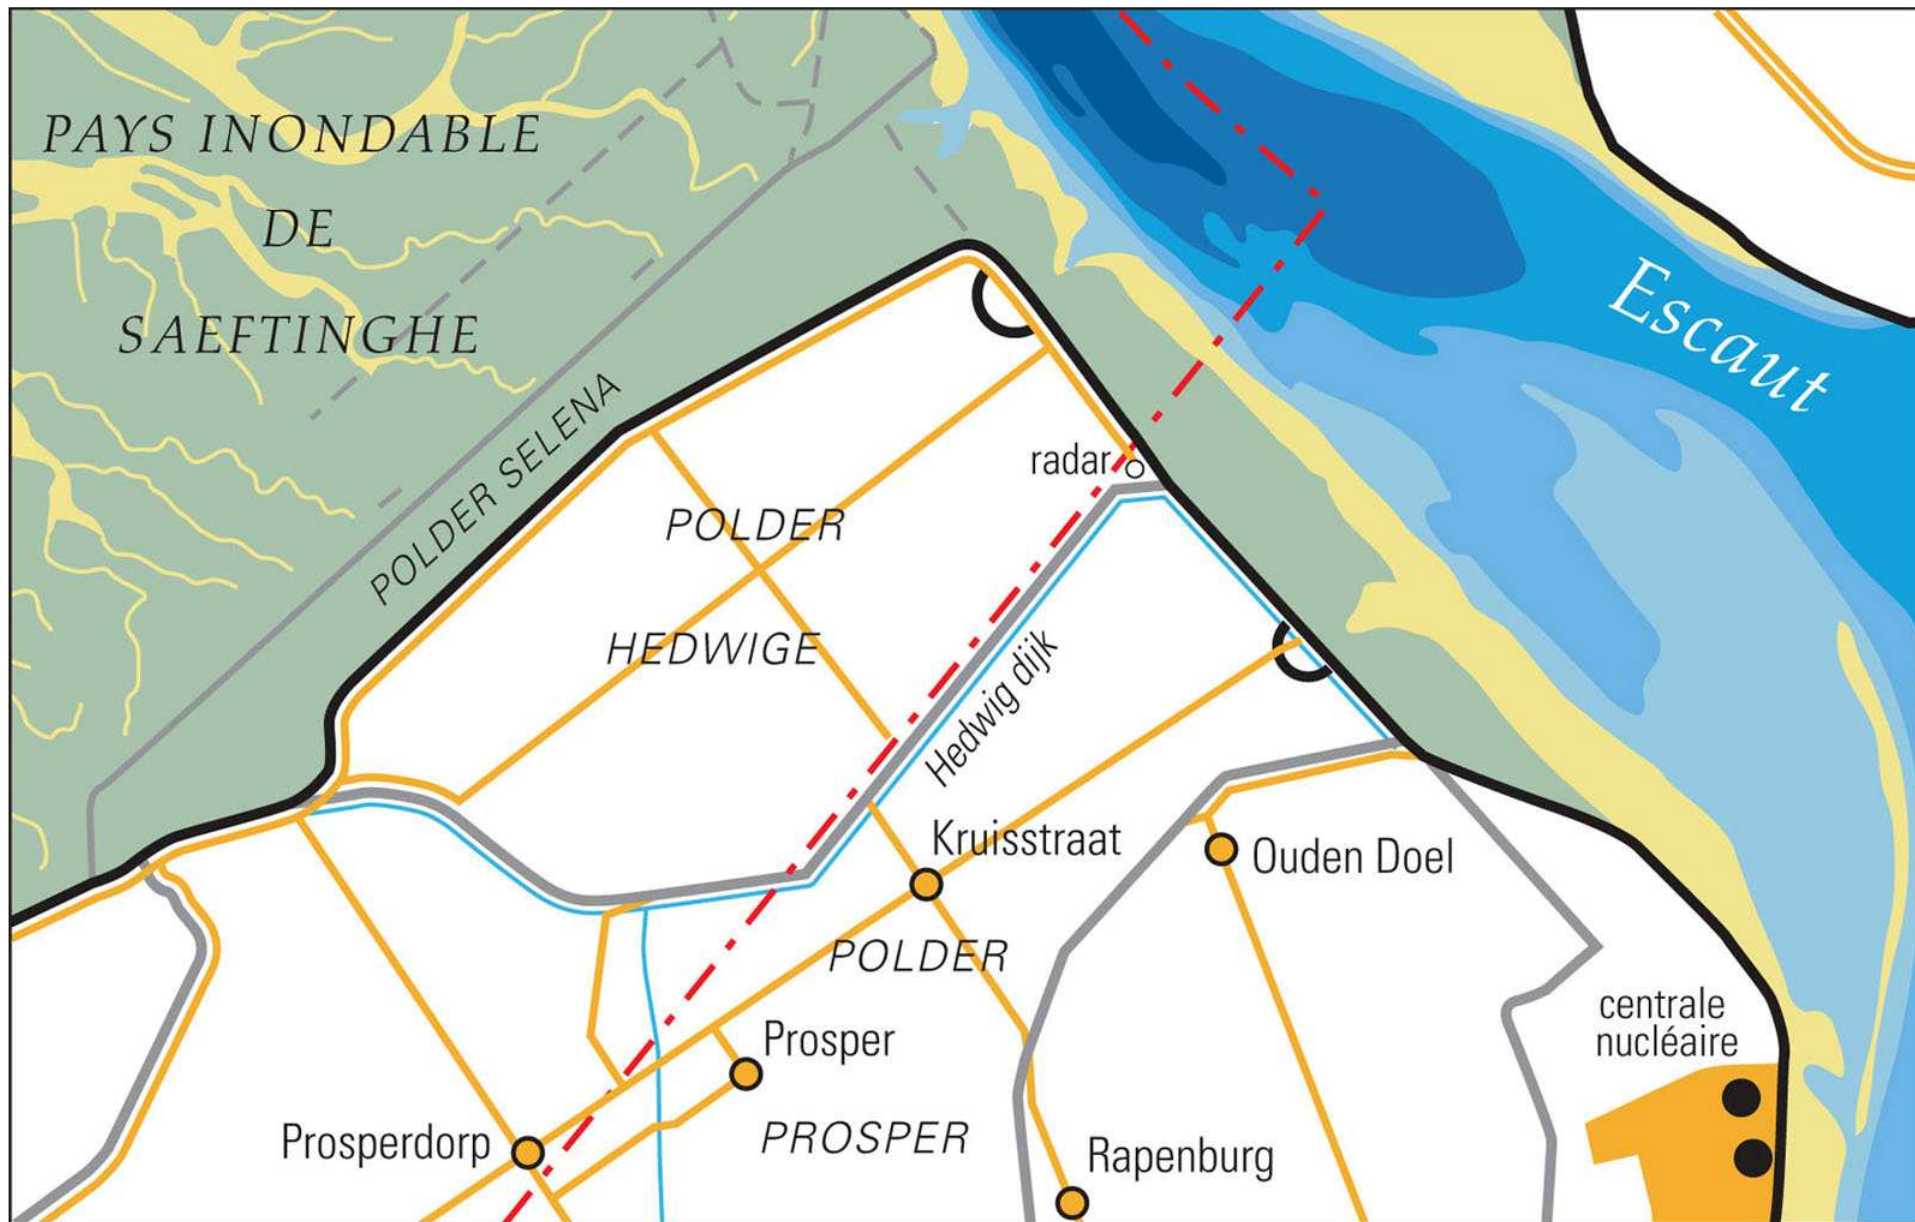

English Nature is managing this land as an experimental site for sea defence set-back. This involves building a new sea wall at a more landward location, breaching the old wall, and allowing saltmarsh to return to the intervening land. This new saltmarsh will act as a natural defence and help replace saltmarshes lost to erosion and historical reclamations in the Tollesbury Fleet. The trial will investigate all aspects of this sea defence technique, especially the best management methods for establishment of saltmarsh.

This work is supported by the Flood and Coastal Defence research programme of the Ministry of Agriculture, Fisheries and Food. For more information, contact the Maritime Team, English Nature, Northminster House, Peterborough, PE1 1UA.
